

AI USAGE NOTE

1. What AI Helped With

AI assisted in building and debugging the full-stack ReviewPilot project across backend, frontend, and integration layers.

Key contributions:

- Fixed FastAPI backend errors and API failures
- Debugged MCP tool execution and RAG pipeline issues
- Resolved database migration issues (PostgreSQL → SQLite for local setup)
- Fixed UUID and schema compatibility issues across models
- Debugged GitHub OAuth authentication and API errors
- Resolved “Bad Credentials” issue in GitHub API integration
- Connected frontend with backend APIs successfully
- Fixed repository connection and webhook flow
- Supported Git workflow (branch, push, PR setup)
- Ensured end-to-end system flow (UI → API → backend → response)

2. What AI Got Wrong / Limitations

- Over-suggested switching database architecture early
- GitHub authentication issues were not detected immediately
- Fake repository fallback caused confusion with real API flow
- Some commands were not compatible with terminal environment
- Occasional unnecessary refactoring suggestions instead of minimal fixes

3. Best Prompts Used

- Fix backend with minimal changes, no new files
- Ensure full end-to-end system works on localhost
- Fix GitHub repo integration with token authentication
- Compress prompt for faster execution
- Only fix UUID, API, and DB issues (no redesign)
- Make UI visually modern with bold colors

4. Outcome Summary

The system is fully functional in local environment:

- Frontend successfully communicates with backend
- GitHub API works using personal access token

AI USAGE NOTE

- MCP tools and RAG pipeline are working
- Database runs locally without external dependencies
- End-to-end workflow (UI → API → AI review output) is working
